

ABSTRACT:

A method of and arrangement for providing access to a consumer device (101). A user can switch between multiple content providers. To switch, he calls up a set of representations (202-207) of offerings by content providers (107, 108, 109). He can then select a content provider. The selection is submitted to a gateway system (106), which then
5 provides the selected content provider access to the consumer device (101), preferably in return for a fee paid by the selected content provider. The invention makes it easier for users to switch content providers even when descrambling boxes, subscriptions and other hassles are normally involved in switching. All these hassles are taken care of by the gateway (106).
